Research and development for an Internet-facilitated distributed community of practice (DCoP) for special education in Bulgaria is in its final phase. The DCoP is called Special Education Bulgaria. Results from the needs assessment indicated that special education researchers, practitioners, and parents in Bulgaria would benefit from such a community and that there is sufficient Internet access. Formative evaluation results directed website usability and sociability improvements and the incorporation of Moodle, a popular course management system. An effectiveness evaluation is currently underway to investigate the DCoP’s effect on the job performance and satisfaction of special educators. Preliminary results indicate that though a DCoP has begun to coalesce, it may remain unclear if it helps special educators do their jobs better. Partnership with the European Union 6th Framework integrated project, TENCompetence, may help address this finding. The expected outcomes of such a partnership include the implementation and testing of ePortfolios and online courses to assist Bulgarian special educators with lifelong competency development.

Introduction

It is often assumed “that learning is an individual process, that it has a beginning and an end, that it is best separated from the rest of our activities, and that it is the result of teaching” (1999, p. 3). It has also been argued, however, that learning is a social phenomenon resulting from regular interaction with others throughout our daily lives. Based largely on this argument, Lave and Wenger (1991) proposed a social learning model that involved habitual interaction with what they termed a community of practice (CoP) (M. K. Smith, 2003, January). “Communities of practice are groups of people who share a concern, a set of problems, or a passion about a topic, and who deepen their knowledge and expertise in this area by interacting on an ongoing basis” (Wenger, McDermott, & Snyder, 2002, p. 4). Professionals that regularly meet for lunch to discuss their jobs are part of a CoP. The parents of children involved in a sport, who advise each other about parenting, are also part of a CoP. Similarly, with regard to special education in Bulgaria, CoPs already exist. Some are challenged geographically by distance and regional boundaries and others have the potential to form but do not because of the requirements of daily living or separation across cities.

Special Education Bulgaria (SEB) is a CoP for special education researchers, practitioners, teachers in training, and parents. It is facilitated by a website. SEB’s central purpose is to connect extant geographically-dispersed special education communities in Bulgaria. The website, www.specialeducationbulgaria.com, has been updated progressively throughout three phases of research (see Figure 1). The design-based research approach has guided each phase (Brown, 1992; Collins, 1992; Design-Based Research Collective, 2003; Peterson & Herrington, 2005; Reeves, Herrington, & Oliver, 2005; van den Akker, 1999). Theoretical underpinnings originate from the CoP concept but more specifically relate to the distributed community of practice (DCoP) concept described by Wenger et al. (2002).

When the SEB project began in 2005, it was not known if the development of a DCoP facilitated by the Internet would be feasible to establish in Bulgaria. Results from the first two phases of research, however, indicated that it was not only possible, there was a great deal of interest. The website has grown from an initial group of 20 users to more than 200. Further, it appears that this is just the type of project that the European Union (EU) is interested in pursuing (Bulgarian National Assembly, 2001; Commission of the European communities, 2005, December; R. Koper & Stefanov, 2006).
Preliminary results from the third and final research phase, however, indicate that a DCoP alone may not meet the needs of Bulgaria’s special education community. Though the SEB website appears to facilitate community building, it remains unclear if it significantly helps special educators do their jobs better. To address this finding, SEB has looked to the EU’s 6th Framework integrated project, TENCompetence. It is anticipated that the success of a TENCompetence-SEB partnership will depend primarily on the implementation and testing of ePortfolios and online courses to assist special education professionals with lifelong competency development. This paper briefly summarizes the SEB features consistent with TENCompetence concepts of competency development, lifelong learning, and professional networking. It then describes, in detail, the features needed to expand SEB from a DCoP into a suitable TENCompetence pilot. It concludes with a discussion of the widespread benefits of a TENCompetence-SEB partnership.

New objectives

SEB project objectives correlate closely with several of the TENCompetence project objectives (see Figure 2). The website provides discussion forums; chat rooms; a document, photo, and links repository; online voting; RSS news feeds; and other tools and meets all of the necessary DCoP criteria laid out by Preece (2000) and Wenger et al. (2002) including, among others, ease of navigation; and quick, secure access. What appears to be missing, however, is a direct link to standardized competencies and ways of developing such competencies. Hence, to better address all four TENCompetence core objectives, SEB will host online courses targeted at teaching and assessing special education competencies and ePortfolios for substantiating such competencies. The next two sections of this paper explain how online courses and ePortfolios will be integrated.

Online courses

The SEB website is powered by a dependable course management system, Moodle, that is widely praised for its ability to host online courses. To date, however, only the social networking, “learning community,” aspects of Moodle have been employed by SEB (Dougiamas & Taylor, 2003; Dougiamas

---

1 TENCompetence seeks to research and develop innovative methods and technologies for lifelong learning and competency tracking, development, and assessment that will be applicable to a wide range, if not all, professions in the EU (see Figure 2).

2 At the time of publication, it was not know if an SEB pilot, as currently proposed, would be accepted by TENCompetence. Regardless, expansions will continue as planned as they are predicted to be vital for the long-term success of SEB.

3 Moodle is an open-source course management system that was created in 1999 by Martin Dougiamas during his PhD candidature at Curtin University of Technology in Perth, Western Australia. It has since evolved substantially and is available for use in more than 50 languages, including Bulgarian (Moodle community, n.d.).
The following section discusses the competencies to be targeted by SEB and how online courses will be integrated to better address TENCompetence objective number 3 (see Figure 2).

Objectives currently addressed by SEB:
1. "Methods and technologies for the creation, storage, use, and exchange of knowledge resources"
2. "Models, methods and technologies for the creation, storage, use, and exchange of networks of competence development programs"

Objectives to be addressed after the addition of online courses and ePortfolios:
3. "Standards-based methods and tools for the creation, storage, use, and exchange of formal and informal learning activities and units of learning"
4. "Methods and technologies for the creation, storage, use, and exchange of formal and informal competence development programs"

Figure 2: TENCompetence project core objectives (Rob Koper & Specht, 2007, p. 232)

Targeted competencies

SEB co-supervisor, Tzvetkova-Arsova, is a widely recognized expert on the education of the visually and multiply impaired. Hence, the decision about which competencies to target for a trial online course was relatively easy. The primary standard that she follows is from the United States and titled, Perkins School for the Blind Competencies for Teachers of Learners Who Are Deafblind (McLetchie & Riggio, 1997). The following competencies are addressed by the Perkins document:

1. Effects of deaf-blindness
2. Personal identity, relationships, and self-esteem
3. Concept development
4. Communication
5. Auditory and visual systems
6. Orientation and mobility
7. Environment and materials
8. Professional issues

An appendix to the Perkins document is included that lists a comprehensive set of competencies essential for all beginning special education teachers regardless of their specialization. The appendix is an excerpt from an international standard published by the Council for Exceptional Children (1995; 2003). The additional competencies addressed include:

1. Philosophical, historical and legal foundations of special education
2. Characteristics of learners
3. Individual differences
4. Instructional strategies
5. Learning environments and social interactions
6. Language
7. Instructional planning
8. Assessment
9. Professional and ethical practice
10. Collaboration

Development and deployment plan

Initially, online course development will coincide with a month-long professional development course offered by Sofia University’s Department of Special Education. The course specifically targets unemployed Bulgarian teachers interested in retraining as special educators. Ten students are anticipated to enrol for each course and attend five days a week for four weeks. Two 150-academic-hour modules will be covered during each intensive course. The modules available include education of the hearing impaired; education of the visually impaired; education of the intellectually disabled; and speech therapy. In addition, 300-academic-hour modules are available for adapted physical activities; and social work. The total number of month-long courses offered will depend on demand.

Lectures that address the target competencies listed above will be videotaped and posted to SEB. A password-protected Moodle course module has been created to host the videos. Students in the course will be able to review videotaped lectures from the previous week and discuss them online. A double-sided postcard handout was created and will be distributed to students that explains how to register for

---

4 Though the Perkins competencies have not been updated since 1997, the School does not intend to update them in the near future as they are still quite valid (S. Sullivan, personal communication, May 2007). There is a companion document available for paraprofessionals, but the original 1997 document is still the best choice for the trial course.
SEB and how to access the online course. The pedagogical principles followed will vary because each lecture will be delivered by a different department member. The various pedagogical principles used will be reviewed during the development period (see Figure 3). The most appropriate principles as well as the most appropriate units of learning will be decided upon during this period.

In addition to video, the learning materials provided in the course will be posted to SEB. As course materials are posted, relevant IMS specifications will be kept in mind (IMS Global Learning Consortium, 2007). The latest version of Moodle, 1.9, does not fully support IMS content exporting. Full support is expected later this year (Moodle community, 2007b).

During SEB pilot A, access to online materials and discussion forums will not be strictly required (see Figure 3). The new TENCompetence personal competence manager (PCM) client software will also be piloted. During pilot B, online course access will be required to a greater degree, but a blended approach will still be required. Future courses may be offered only at a distance, possibly during cycle 3. The distance approach would support teacher training in authentic work environments accompanied by peer tutoring. The approach would also suit current trends in Bulgarian special education. Such trends include the integration of students with special needs into regular schools and transitioning role of teachers currently employed in special schools. Refer to the “Win-win” section below.

The cycle 1 pilots, now approaching the analysis and reporting stage, include ICT teacher training, coordinated by Sofia University; and Digital cinema professional training, coordinated by the Universitat Pompeu Fabra, Barcelona. The cycle 2 pilots proposed, among others, include a large-scale pilot to pair competencies from academia with the needs of local industry; medical pilot on colorectal cancer; pilot for digital cinema training via gaming simulation; and second ICT teacher training pilot. The SEB proposal, described herein, is for a pilot on teacher training for education of the deafblind and multiply handicapped. All cycle 2 pilots will test the new TENCompetence PCM client software (Arenales et al., 2006, November; Stefanov, Naskinova, & Nikolov, 2007).

ePortfolios

Key to the competence development process described by Schoonenboom, Tattersall, Miao, Stefanov, and Aleksieva-Petrova (2006) is the use of ePortfolios. The process is described as follows.

As a learner starts with competence development, self assessment will be the most prominent, if not the only, form of assessment. This orientation stage is followed by a stage of evidence collection, which is supported by e-portfolio building. In a third stage, the learner is judged by others, and in this stage organisations make use of assessment forms such as on-the-job assessment, 360-degree assessment and assessment centres. In the fourth stage, the learner performs competence development activities. (Schoonenboom et al., 2006, p. 1)
ePortfolios are critical to the success of this model and to the TENCompetence project (TENCompetence, 2005, March). SEB will provide formal opportunities for competency development as described in the “Online courses” section above. The following section describes the types of ePortfolios relevant to SEB and how they will be integrated. ePortfolio integration is intended to help SEB better address TENCompetence objectives numbers 2 and 4 (see Figure 2).

Types of ePortfolios

“Very simply put, a portfolio is a collection of evidence that is gathered together to show a person’s learning journey over time and to demonstrate their abilities” (Butler, 2006, October, p. 2). For SEB, ePortfolios will be used to showcase the credentials and lifelong learning path of professionals in a specific discipline. Summarizing Butler’s (2006, October) literature review, it can be argued that there are four types of portfolios:

1. Showcase or dossier portfolios: show achievements in study or in the workplace for job selection, promotion, or professional networking
2. Learning, process, or training portfolios: document learning over time
3. Credential or assessment portfolios: for evaluation, registration, or certification purposes
4. Personal development, self-directed, or reflective portfolios: document self-directed learning

Butler argues that “the varying ways of typifying a portfolio all serve to emphasise the importance of deciding upon the purpose and audience of the portfolio” (2006, October, p. 3). The first type of portfolio listed, showcase portfolio, is most relevant to SEB. The target audience includes:

- Students preparing to enter the special education workforce
- Practising special educators
- Teacher trainers
- Researchers

Development and deployment plan

At this time, Moodle does not offer ePortfolios, but code is available to help integrate Elgg (Moodle community, 2007a). Elgg is a popular open-source program for social networking and ePortfolio creation. Essentially, it allows for the creation of websites similar to MySpace or Facebook, two of the most popular websites on the Internet. According to Alexa Internet, MySpace is the 6th most visited website and Facebook the 17th (Alexa Internet, 2007; Andrews, 2007, April 19; Eduspaces community, 2007; Elgg community, 2007; O’Hear, 2006, March 7).

To SEB users, integrating Elgg with Moodle will only mean clicking the “portfolio” link from the main menu on the homepage. From there, users will be directed to example portfolios. Templates will be created for each type of user in the target audience list above. SEB ePortfolios are anticipated to include resumes; detailed descriptions of educational certifications, work experience, and competencies; photos; scanned or PDF documents that validate achieved competencies; learning plans for desired competencies; academic and professional references; accolades; published and unpublished works; and anything else relevant to a special educator’s academic and professional career. The timeframe planned for Elgg integration is listed in Figure 3.

At present, it is uncertain if Elgg open-source development will include conformance to IMS ePortfolio specifications (IMS Global Learning Consortium, 2007). This is important because ePortfolios need to be portable, meaning that users can take their content and easily reuse it in the future. TENCompetence argues that ePortfolios should be owned by the user and standardized across Europe so that they can easily be shown to any employer or learning provider (TENCompetence, 2005, March). Moodle intends to feature its own ePortfolio system in the near future, at which time SEB’s Elgg system will be reviewed. Moodle’s roadmap also includes provisions for compliance with IMS specifications (Moodle community, 2007b).

5 Arguments have been made that ePortfolios are basically electronic versions of paper portfolios. Butler (2006, October) cites a work by Barrett and Knezek (2003) to support this claim. Butler tends to use the terms portfolio and ePortfolio interchangeably but attentively discusses the additional considerations, namely technical, required to implement ePortfolios.
Win-win

There are many reasons why the SEB expansion described herein is a win-win opportunity for Bulgaria, special educators, special needs students, TENCompetence, and the EU. For one, the expansion suits Bulgarian and EU plans to implement lifelong learning solutions facilitated by information technology (Bulgarian National Assembly, 2000; Commission of the European communities, 2005, December).

Secondly, TENCompetence requires cycle-2 pilots that address non-technical competencies; address competency development in authentic work environments; can test the new TENCompetence PCM client software; are sustainable after research completes; employ open-source, standards-based technologies, such as Moodle; and attract long-term associate partners, such as Sofia University’s Department of Special Education and Bulgaria’s Ministry of Education and Science (Hemmje, Majek, Massy, & Westhoff, 2007, February).

Furthermore, Bulgaria is transforming continually to meet EU requirements. The EU currently focuses on judicial system reform and organized crime and corruption (Commission of the European communities, 2006, September). As the Bulgarian government attends to these front-page concerns, other issues, such as Bulgaria’s faltering university system (Popkostadinova, 2007, May), may be overlooked. Other examples include the need to improve the quality of support available to disabled children; integrate special needs students into the regular school system; and integrate Roma children (Rowling, 2006, February 5; N. Smith, 2005, October 9, 2006, April 16, 2006, April 28, 2006, October 01; Tzvetkova-Arsova, 2004; UNICEF, 2007, May; UNICEF Innocenti Research Centre, 2005). The Bulgarian Ministry of Education and Science has published an official strategy for integration, but this is only the first of many steps to come (Bulgarian Ministry of Education and Science, 2004, June). Integration in any country is a very difficult task. Moreover, integration is only the first step toward inclusion6 (Peterson & Konza, 2006).

As Bulgaria transitions to a system of integration, it faces many challenges. Such challenges include the restructuring of hundreds of special schools and institutions and the retraining of special educators and general educators nation wide (Cholakova & Georgieva, 1996; Peterson & Konza, 2006; Tzvetkova-Arsova, 2004). It follows that integration will catalyze a major shift in the competencies required for the practice of special education in Bulgaria. Thus, the integration process has the potential to create unstable demands on the education system unless effective competency development programs, such as those proposed by SEB and TENCompetence, can be provided.

Conclusion

This paper discussed a potential partnership between two research projects: SEB and TENCompetence. Both projects seek to engage Internet technologies, e.g., ePortfolio, online course management, and Web 2.0 social networking software, to facilitate professional development and lifelong learning. SEB requires competency-development tools to better support it members, and TENCompetence requires long-term associate partners. Moreover, both projects expect that early and continual focus on sustainability will lead to long-term adoption of research outcomes. For TENCompetence, sustainability will largely depend on the number and diversity of associate partners recruited. For SEB, sustainability will depend on the quality and relevance of professional development tools and resources provided to its members. Hence, the development of an SEB test pilot for TENCompetence is a win-win opportunity. If successful, similar approaches may be taken for the professional development of special educators in neighbouring Balkan countries, especially those new to or soon to enter the EU.

---

6 Integration is the accommodation of students with special needs in a “normal” education system. Inclusion seeks to completely remove the distinction between special and regular education, and to provide an appropriate education for all students, despite their level of disability, in their local school. It is a philosophical move away from the accommodation of students with special needs into a “normal” system, towards a full inclusion model where everyone is considered normal.
